# Sezione A - TERMOMETRIA

## Abbreviazioni e segni convenzionali

|                                         |     |
|-----------------------------------------|-----|
| Termometro a massima e minima . . . . . | Tm  |
| Termometro registratore . . . . .       | Tr  |
| Dato incerto . . . . .                  | ?   |
| Dato mancante . . . . .                 | »   |
| Dato interpolato . . . . .              | [ ] |

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

## CONTENUTO DELLE TABELLE

I dati sono trasmessi da Osservatori o stazioni termopluviometriche controllati o dipendenti direttamente dall'Ufficio.

Ogni stazione è fornita di un termometro a massima e a minima, che viene osservato ogni giorno alle ore 9 antimeridiane.

Le letture eseguite ai termometri vengono assegnate al giorno stesso dell'osservazione.

Le stazioni sono ordinate nelle tabelle secondo la rispettiva posizione idrografica.

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni termometriche che hanno funzionato nell'anno.

**TABELLA I.** - Sono riportati, per la maggior parte delle stazioni, i valori massimi e minimi rilevati giornalmente, le rispettive medie mensili, la temperatura media del mese e le corrispondenti medie del periodo.

In questo annale la media normale delle temperature è riferita al periodo 1960-77.

**TABELLA II.** - Per tutte le stazioni della tabella I sono riportate:

a) le medie mensili ed annue delle massime e delle minime temperature osservate giornalmente e le medie mensili ed annue delle temperature diurne. Come «temperatura diurna» è assunto il valore della semisomma delle temperature massima e minima osservate in uno stesso giorno;

b) le temperature estreme (massima e minima) osservate in ogni mese e nell'anno, ed il giorno nel quale sono state osservate.

Tutte le temperature riportate sono espresse in gradi centigradi e corrispondono alle letture effettivamente eseguite, non essendosi effettuata la riduzione al livello del mare.

## CONSISTENZA DELLA RETE TERMOMETRICA AL 31 DICEMBRE 1978

### TERMINOLOGIA

1. — Altezza di precipitazione (mm): quoziente del volume di acqua raccolta nel pluviometro (compresa, eventualmente, la neve sciolta) per l'area della superficie orizzontale dell'imbuto raccoglitore.

2. — Giorno piovoso: giorno in cui è stata misurata un'altezza di precipitazione uguale o superiore ad un millimetro.

3. — Ora di pioggia o piovosa: ora nella quale è stata registrata da un pluviografo un'altezza di precipitazione uguale o superiore a 0,2 mm.

4. — Intensità media di precipitazione in un dato intervallo di tempo: quoziente dell'altezza di precipitazione nell'intervallo per la durata di questo.

## CONTENUTO DELLE TABELLE

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni di osservazione che hanno funzionato nell'anno.

I valori delle precipitazioni riportati sono espressi in millimetri di acqua e comprendono pioggia e neve fusa.

**TABELLA I.** - Per ogni stazione riporta la quantità di pioggia caduta giornalmente ed i totali mensili ed annuo della precipitazione e del numero dei giorni piovosi.

Per le stazioni dotate di apparecchiatura a lettura diretta (pluviometri) le osservazioni vengono eseguite ogni giorno alle ore 9 ed il risultato viene attribuito al giorno stesso della misura: il valore segnato rappresenta quindi la quantità di precipitazione caduta nelle 24 ore che hanno preceduto la misura.

Per le stazioni dotate di pluviografo si riporta, per ogni giorno, la quantità di pioggia che dal diagramma risulta caduta nelle 24 ore comprese fra le ore 9 del giorno precedente e le ore 9 del giorno di cui si tratta.

Con carattere **grassetto** è stampato il massimo quantitativo giornaliero misurato per ogni mese.

**TABELLA II.** - Per le stesse stazioni di cui alla tabella I, riporta i totali mensili ed annui delle quantità di precipitazione.

Per ciascuna stazione è riportato in **grassetto** il più elevato dei valori mensili ed in *corsivo* il più basso.

**TABELLA III.** - Per le stazioni dotate di pluviografo riporta i dati relativi ai valori più elevati delle precipitazioni registrate, nell'anno, per 1, 3, 6, 12 e 24 ore consecutive appartenenti o non allo stesso giorno.

Sono considerate le precipitazioni iniziate dopo le ore 0 del primo gennaio e quelle, eventualmente terminate dopo le ore 24 del 31 dicembre.

**TABELLA IV.** - Riporta i massimi valori delle precipitazioni verificatesi per 1, 2, 3, 4 e 5 giorni consecutivi, appartenenti o non allo stesso mese. Sono considerati solamente i periodi il cui inizio cade entro l'anno anche se eventualmente sono terminati nell'anno successivo.

**TABELLA V.** - Riporta il valore, la durata e la data delle precipitazioni di maggiore intensità e di breve durata registrate dai pluviografi.

**TABELLA VI.** - Riporta per i mesi da gennaio a maggio e da ottobre a dicembre nei quali possono verificarsi precipitazioni nevose.

a) le altezze in centimetri degli strati nevosi sul suolo presenti nell'ultimo giorno delle tre decadi mensili;

b) il numero dei giorni nei quali si sono avute precipitazioni nevose (non sono conteggiati i giorni con valori di neve sciolta inferiore ad 1 mm).

c) il numero complessivo dei giorni di permanenza della neve sul suolo.

### CONSISTENZA DELLA RETE PLUVIOMETRICA AL 31 DICEMBRE 1978

## Sezione C - METEOROLOGIA

Nel presente capitolo sono riportati per l'Osservatorio Meteorologico di Trento - Laste i valori della pressione atmosferica, dell'umidità relativa, dell'insolazione, del vento e della nebulosità. Sono riportati inoltre i valori della pressione atmosferica rilevati alla stazione di Pinzolo ed i valori dell'insolazione rilevati alla stazione del Careser. I dati della temperatura e delle precipitazioni sono riportati nelle rispettive Sezioni A e B.

### CONTENUTO DELLE TABELLE

**TABELLA I.** - Riporta i valori medi giornalieri, mensili ed annui della pressione atmosferica espressa in mm di mercurio, a zero gradi e non ridotta al mare.

**TABELLA I/A.** - Riporta i valori per decadi mensili della pressione atmosferica espressa in mm di mercurio a zero gradi e ridotta al mare, le medie mensili, i valori estremi e l'escursione al mare.

**TABELLA II.** - Riporta i valori medi giornalieri, mensili ed annui dell'umidità relativa. Il valore dell'umidità relativa (espresso in centesimi) è quello del rapporto fra la tensione del vapor acqueo misurato e la tensione massima corrispondente alla temperatura rilevata durante l'osservazione.

**TABELLA III.** - Riporta il totale giornaliero, mensile e annuo di insolazione espressa in ore.

**TABELLA IV.** - Riporta i valori medi giornalieri, mensili ed annui della velocità del vento espressi in km/ora e contiene, inoltre, la direzione del vento prevalente durante il giorno e la durata in ore durante la quale esso ha soffiato, nonché la velocità media oraria massima e la sua direzione.

**TABELLA IV/A.** - Riporta le frequenze del vento nelle singole direzioni, cioè il numero d'ore in cui il vento soffiò, nei dodici mesi dell'anno, dalle 16 direzioni principali.

**TABELLA V.** - Riporta i valori medi giornalieri, mensili ed annui della nebulosità espressa in decimi di cielo coperto.

I valori medi giornalieri della pressione e dell'umidità sono calcolati in base a valori biorari, quelli della velocità del vento in base a valori orari, mentre quelli della nebulosità corrispondono alla media aritmetica delle osservazioni alle ore 7 - 14 - 19.

Per tutti gli elementi meteorologici riportati in questo capitolo, viene adottato il giorno civile, dalle ore 0 alle 24.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

## Sezione D - AFFLUSSI METEORICI

### TERMINOLOGIA

1. — Afflusso meteorico ( $m^3$ ) ad un bacino idrografico in un dato intervallo di tempo: volume totale della precipitazione sul bacino in quell'intervallo.

2. — Altezza di afflusso meteorico (mm) ad un bacino idrografico per un determinato intervallo di tempo: spessore dello strato d'acqua di volume pari all'afflusso

meteorico in quell'intervallo ed uniformemente distribuito sulla superficie del bacino.

3. — Contributo medio di afflusso meteorico ( $l/s.km^2$ ) ad un bacino idrografico in un dato intervallo di tempo: quoziente fra l'afflusso meteorico al bacino nell'intervallo ed il prodotto della durata di questo per l'area del bacino.

### CONTENUTO DELLA TABELLA

Riporta, per gli interi bacini imbriferi e per le loro parti più importanti, le altezze di afflusso meteorico mensili ed annue, espresse in mm, ed i corrispondenti contributi medi espressi in  $l/s.km^2$ .

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

## TERMINOLOGIA

1. — Altezza idrometrica (cm): altezza del livello liquido sopra o sotto lo zero dell'idrometro.
2. — Altezza di massima piena o magra in una sezione fornita di idrometro e per un lungo periodo di osservazione: massima o minima altezza idrometrica (m) raggiunta in tutto il periodo di tempo in cui sono state effettuate le osservazioni.
3. — Altezza di piena ordinaria (cm) in una sezione fornita di idrometro e per un lungo periodo di osservazione (alcuni decenni): altezza idrometrica uguagliata e superata dalle massime altezze annue verificatesi nella sezione per il 75% degli anni di osservazione.
4. — Altezza di magra ordinaria (cm) in una sezione fornita di idrometro e per un lungo periodo di osservazione (almeno un decennio): altezza idrometrica uguagliata e superata dalle minime altezze annue verificatesi nella sezione per il 75% degli anni di osservazione.

## CONTENUTO DELLA TABELLA

La tabella è preceduta dall'elenco e caratteristiche delle stazioni idrometriche che hanno funzionato nell'anno.

TABELLA I. — Riporta, per alcune stazioni, le altezze idrometriche rilevate direttamente all'idrometro da parte dell'osservatore oppure dedotte in corrispondenza del mezzogiorno dallo spoglio dei diagrammi per le stazioni fornite di apparecchio registratore.

## CONSISTENZA DELLA RETE IDROMETRICA AL 31 DICEMBRE 1978

| ZONA DI ALTITUDINE<br>m | I         | Ir        |
|-------------------------|-----------|-----------|

\* Quote approssimative.

(1) Nel periodo dal 19.9.78 al 2.10.78 la Brentella di Caldonazzo è stata sbarrata per lavori in alveo.

(2) L'altezza di massima piena è stata superata nel novembre 1966, ma causa l'asportazione dello strumento non è stato possibile ricavarne il dato.

(3) In seguito alla costruzione degli impianti idroelettrici di Pozzolago, il bacino del lago delle Piazze (kmq. 2,0), prima appartenente al bacino del Fersina, viene a far parte del bacino dell'Avisio. È stata quindi apportata tale variante alla superficie del Fersina e dell'Adige a Trento.

(4) Dal mese di agosto le altezze idrometriche del lago di Canzolino sono influenzate da pompaggi.

Non sono riportate le osservazioni delle stazioni stampate in corsivo.

## TERMINOLOGIA

1. — Portata in una sezione e in un dato istante ( $m^3/s$ ): volume di acqua che attraversa la sezione durante l'unità di tempo (minuto secondo) che comprende quell'istante.
2. — Portata unitaria (o contributo) relativa ad una determinata sezione  $l/s\ km^2$ : rapporto tra la portata nell'unità di tempo (s) e l'area del bacino imbrifero sotteso dalla sezione.
3. — Portata media in una sezione e per un dato intervallo di tempo: rapporto tra il deflusso relativo all'intervallo e la durata di questo.
4. — Modulo di una sezione: portata media di un gran numero di anni.
5. — Portata giornaliera in una sezione e per un determinato giorno: portata media nella sezione in quel giorno.
6. — Durata di una determinata portata  $Q$  in una sezione e relativamente ad un certo intervallo di tempo: numero di giorni di quell'intervallo, nei quali si è verificata una portata non inferiore a  $Q$ .
7. — Portata semipermanente in una sezione e in un dato intervallo di tempo: portata che non è stata superata per metà dei giorni dell'intervallo (ossia di durata uguale a metà dell'intervallo).
8. — Portata semiannuale di un anno determinato: la portata semipermanente di quell'anno.
9. — Deflusso di una determinata sezione e per un determinato intervallo di tempo ( $m^3$ ): volume liquido che ha attraversato la sezione nell'intervallo.
10. — Altezza di deflusso di un bacino idrografico per un determinato intervallo di tempo (mm): spessore dello strato d'acqua di volume pari al deflusso superficiale del bacino in quell'intervallo e uniformemente distribuito sulla superficie del bacino.
11. — Deflusso giornaliero in una determinata sezione e per un dato giorno ( $m^3$ ): volume liquido che ha attraversato la sezione in quel giorno.
12. — Deflusso unitario relativo ad una determinata sezione ed in un dato intervallo di tempo ( $m^3/km^2$ ): rapporto tra il deflusso dell'intervallo e l'area del bacino imbrifero sotteso dalla sezione.
13. — Perdita apparente di un bacino idrografico in un determinato intervallo di tempo: differenza fra l'altezza di afflusso meteorico e l'altezza di deflusso relative all'intervallo.
14. — Coefficiente di deflusso di un bacino idrografico in un determinato intervallo di tempo: rapporto tra l'altezza di deflusso e l'altezza di afflusso meteorico relative all'intervallo.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi.

## CONTENUTO DELLE TABELLE

Le tabelle sono precedute da una cartina della Provincia, corredata da un elenco, ove sono ubicate le stazioni di misura che hanno regolarmente funzionato nell'anno.

Nelle tabelle, per ogni stazione, sono riportati:

a) le caratteristiche della stazione e del bacino che alimenta il corso d'acqua relativo con la indicazione delle altezze idrometriche e delle portate, massime e minime, relative nel periodo di osservazione;

b) le portate medie giornaliere espresse in  $m^3/s$ ;

c) gli elementi caratteristici mensili ed annui, dell'anno e del precedente periodo di osservazione (le portate in  $m^3/s$ , massime, minime e medie giornaliere, i deflussi e gli afflussi in mm; i coefficienti di deflusso - rapporto tra i deflussi e i corrispondenti afflussi);

d) le portate medie giornaliere corrispondenti a valori caratteristici delle durate espresse in giorni;

e) la scala numerica delle portate, cioè la traduzione analitica della relazione intercorrente tra le portate e le altezze idrometriche rilevate nella sezione di misura.

## ELENCO DELLE STAZIONI

- 1 - Brentella di Caldonazzo a Brenta
- 2 - Brentella di Levico a Levico
- 3 - Brenta a Levico P.te Cervia
- 4 - Brenta a Borgo Valsugana
- 5 - Rabbies a S. Bernardo di Rabbi
- 6 - Avisio a Soraga
- 7 - Canale di gronda Lago delle Piazze
- 8 - Adige a Trento
- 9 - Sarca di Nambrone a Pian Nambron
- 10 - Sarca di Campiglio a P.te Piazza

# 1 - BRENTELLA di CALDONAZZO a BRENTA (M)

CARATTERISTICHE DELLA STAZIONE: Bacino di dominio 53.2 km<sup>2</sup> (parte permeabile 31%); aree glaciali 0 km<sup>2</sup>; altitudine max 2150 m.s.m.; media 794 m.s.m.; zero idrometrico 448.23 m.s.m.; distanza dalla origine km 0.50 circa; inizio osservazioni 1951; inizio misure 1947. Altezza idrometrica max m 1.65 (6 nov. 1966), minima m 0.09 (vari nov. 1978). Portata max m<sup>3</sup>/sec. \* (\*), portata minima m<sup>3</sup>/sec. \* (\*).

(\*) L'altezza di massima piena è stata superata nel novembre 1966, ma causa l'asportazione dello strumento non è stato possibile ricavarne il dato.  
NB. - Alle portate defluenti alla stazione di misura, sono state aggiunte quelle della roggia derivata.

# 7 - CANALE di GRONDA LAGO delle PIAZZE (Mr)

CARATTERISTICHE DELLA STAZIONE: Bacino di dominio 32.2 km<sup>2</sup> (parte permeabile 0%); aree glaciali 0 km<sup>2</sup>; altitudine max 2490 m.s.m.; media 1450 m.s.m.; zero idrometrico 1033 m.s.m.; distanza dal lago km 0.010 circa; inizio osservazioni 1964; inizio misure 1972. Altezza idrometrica max m 0.90 (4 ott. 1978), minima m 0.02 (20-21-22 ago. 1974). Portata max m<sup>3</sup>/sec. 3.91 (4 ott. 1978), portata minima m<sup>3</sup>/sec. » (\*).

# 9 - SARCA di NAMBRONE a PIAN NAMBRON (Mr)

CARATTERISTICHE DELLA STAZIONE: Bacino di dominio 21.2 km<sup>2</sup> (parte permeabile 0%); aree glaciali 0.55 km<sup>2</sup>; altitudine max 3556 m.s.m.; media 2329 m.s.m.; zero idrometrico 1350 m.s.m.; distanza dalla confluenza col Sarca km 7 circa; inizio osservazioni 1955; inizio misure 1955. Altezza idrometrica max m 2.12 (17 sett. 1960), minima m 0.04 (1-2 mar. 1977). Portata max m<sup>3</sup>/sec. 70.0 (17 sett. 1960), portata minima m<sup>3</sup>/sec. 0.12 (vari 1956/63/65).

## TERMINOLOGIA

Altezza freatimetrica (m): altezza del livello liquido nel pozzo sul livello del mare.

## CONTENUTO DELLA TABELLA

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni freatimetriche che hanno funzionato nell'anno.

TABELLA I - Riporta i valori giornalieri dei livelli freatici, riferiti al medio mare, il valore medio mensile ed annuo.

# CARATTERI IDROLOGICI DELL'ANNO 1978

I valori rilevati all'Osservatorio meteorologico di Trento ed in alcune stazioni termopluviometriche, idrometriche e di misura delle portate, opportunamente scelte nella provincia, sono messi a confronto con i rispettivi valori medi di un lungo periodo di osservazioni (valori normali).

## I — TEMPERATURA

La temperatura media annua alla stazione di Trento (Laste), come risulta dalla tab. I, si differenzia dal valore normale di  $-0,8^{\circ}\text{C}$ .

Scostamenti più accentuati delle medie mensili dai valori normali si notano nei mesi di febbraio, maggio e luglio.

Dalla tab. II, dove i valori delle temperature medie stagionali sono posti a confronto, con i rispettivi valori normali, si nota come l'estate sia stata alla stazione di Trento più fredda del normale.

Le temperature medie stagionali dell'inverno, della primavera e dell'autunno sono inferiori ai valori normali e di poco si distanziano dalla media del periodo.

I massimi ed i minimi assoluti dell'anno sono contenuti negli estremi sinora osservati.

## II — PRESSIONE ATMOSFERICA

La pressione atmosferica media annua registrata all'Osservatorio di Trento è stata di mm 733,3; essa è inferiore di mm 0,8 al valore normale.

Ad eccezione dei mesi di ottobre e novembre, con pressioni medie mensili superiori ai valori normali rispettivamente di mm 1,0 e di mm 4,8, nei rimanenti mesi la pressione media mensile è stata inferiore alla media normale con scostamenti compresi tra mm  $-0,7$  di marzo e mm  $-3,8$  di dicembre.

Il valore massimo della pressione giornaliera si nota nel mese di gennaio con mm 746,0; il valore minimo nel mese di dicembre con mm 718,2.

## III — VENTO

La velocità media annua del vento nel 1978 (tab. III) all'Osservatorio di Trento è stata inferiore al valore normale.

I valori medi mensili della velocità del vento sono inferiori ai rispettivi valori normali: la dif-

ferenza massima si nota nel mese di aprile con km/h 3,0.

La massima velocità media mensile si è registrata in agosto.

La massima velocità oraria è stata registrata nel mese di marzo con km/h 29 da ENE.

## IV — UMIDITA' RELATIVA

La media annua dell'umidità relativa del 1978 a Trento (tab. IV) è stata superiore alla media normale di 2 centesimi.

Il mese più asciutto per Trento è stato marzo; la maggiore umidità è stata registrata nel mese di dicembre.

L'umidità media mensile è stata superiore al normale nei mesi di gennaio, febbraio, aprile, maggio, luglio, agosto e dicembre; nei rimanenti è risultata inferiore od uguale.

Il maggiore scostamento positivo dal valore normale si registra nel mese di febbraio con 10 centesimi; quello negativo a settembre con 7 centesimi.

## V — PRECIPITAZIONI

La tab. V è utile per confrontare i valori mensili ed i totali annui delle precipitazioni del 1978 con quelli di un periodo di osservazioni più lungo.

La cartina della fig. 1 evidenzia le zone con precipitazioni superiori al valore normale. La caratteristica saliente del regime mensile delle precipitazioni è data dall'abbondanza degli afflussi meteorici osservati nei mesi di gennaio e febbraio.

Dall'esame dei valori riportati nella tab. VI si nota come l'autunno sia stata la stagione meno piovosa.

## PRECIPITAZIONI NEVOSE

Nella tab. VI, a pag. 72 e seguenti della sezione C, per le stazioni nelle quali vengono fatte osservazioni nivometriche, sono riportate le altezze del manto nevoso rilevate il giorno 10, il giorno 20 e l'ultimo giorno del mese. Vengono inoltre evidenziati i totali mensili dei giorni con precipitazioni nevose e quelli di permanenza della neve al suolo.

Le maggiori precipitazioni nevose si sono registrate durante il mese di gennaio.

## VI — IDROMETRIA

Nella «Sezione E - Idrometria» sono riportate le caratteristiche delle stazioni idrometriche e, per le stazioni che hanno funzionato regolarmente tutto l'anno, le altezze idrometriche meridiane e le rispettive medie mensili ed annue.

Dall'esame dei livelli idrometrici, premesso che gli stessi, osservati in una sezione durante un certo periodo di anni, hanno un valore relativo in quanto le variazioni d'alveo alterano, spesso in modo sensibile, i parametri di confronto, si rileva quanto segue.

Le massime altezze idrometriche assolute dell'anno sono inferiori ai rispettivi valori del periodo, ad eccezione del Rabbies e del canale di gronda del lago delle Piazze e si registrano: nel mese di maggio nel bacino del Brenta, sul f. Sarca a Ponte Piazza e sul f. Chiese; nel mese di luglio sul f. Adige.

Le minime altezze idrometriche assolute dell'anno sono superiori ai rispettivi valori del periodo, ad eccezione della Brentella di Caldonazzo

e del Brenta ad Ospedaletto e si registrano: nel mese di settembre nel bacino del Brenta; nel mese di dicembre sul f. Adige e sul f. Chiese; nel mese di febbraio sul f. Sarca a Ponte Piazza.

I valori massimi delle altezze idrometriche medie mensili si registrano: nel mese di maggio nel bacino Brenta e nel mese di giugno sul f. Adige, sul f. Sarca a Ponte Piazza e sul f. Chiese.

I valori minimi delle altezze idrometriche medie mensili si registrano: nel mese di dicembre nel bacino del Brenta, dell'Adige e del Chiese e nel mese di febbraio nel bacino del Sarca.

E' però da tener presente che, sia sui livelli idrometrici massimi ed ancor più sui livelli minimi dell'anno, hanno influenza le alterazioni provocate dall'azione regolatrice dei serbatoi idroelettrici.

Nella tab. VII sono riportate, per alcune stazioni, le altezze idrometriche massime e minime assolute dell'anno e quelle del precedente periodo di osservazione.

Tabella VII - Altezze idrometriche massime e minime assolute del 1978 e del precedente periodo di osservazioni

## VII — PORTATE E BILANCI IDROLOGICI

Nella «Sezione F - portate e bilanci idrologici» sono esposti i valori delle portate medie giornaliere, mensili ed annue per n. 10 sezioni di corsi d'acqua, nelle quali sono state eseguite sistematiche misure di portata e per le quali è stato possibile tracciare regolari scale di deflusso.

Per le sezioni, il cui regime di deflusso non è alterato da derivazioni o da operazioni d'invaso e svaso dei serbatoi, sono stati calcolati i relativi bilanci idrologici mediante il confronto fra i deflussi e gli afflussi meteorici.

Dall'esame dei valori esposti nella tab. VIII, che riporta per le diverse sezioni di misura il confronto tra i valori delle portate del 1978 ed i corrispondenti valori dei precedenti periodi di osservazione, si rileva che le portate medie annue sono superiori ai valori medi del periodo in tutte le sezioni di misura, ad eccezione del fiume Sarca a Ponte Piazza.

I valori massimi delle portate medie mensili si notano: nel mese di maggio sul f. Brenta a Borgo Valsugana; nel mese di giugno sul f. Adige e sul f. Sarca a Ponte Piazza.

I valori minimi delle portate medie mensili si

notano: nel mese di settembre nel bacino del Brenta; nel mese di dicembre sul f. Adige; nel mese di febbraio sul f. Sarca a Ponte Piazza.

Le portate massime giornaliere si notano: nel mese di maggio nel bacino del Brenta e sul f. Sarca a Ponte Piazza; nel mese di luglio sul f. Adige.

Le portate minime giornaliere si notano: nel mese di settembre nel bacino del Brenta; nel mese di dicembre sul f. Adige; nel mese di marzo sul f. Sarca a Ponte Piazza.

Nell'anno 1978 le portate massime e minime assolute sono contenute nei massimi e minimi assoluti del periodo di osservazione.

## ELEMENTI IDROLOGICI DI PIENA

Per un indice idrologico dei deflussi del f. Adige a Trento Ponte S. Lorenzo, si riportano alcuni elementi caratteristici, come dati di confronto, aggiornati all'anno 1978:

- nella tab. IX l'elenco delle piene con altezza idrometrica uguale o superiore a m 3.60;
- nella tab. X le portate massime annuali al colmo.

Tabella VIII - Confronto fra le portate medie mensili ed annue (in m³/s) del 1978 e quelle del periodo di osservazione

E' una tabella indicatrice dei periodi di morbida che inizia con l'anno 1868 anche se prima dell'anno 1882 la stazione idrometrica di osservazione era interessata dai rigurgiti del ponte in muratura costruito su pile e inoltre poteva risentire in quel lontano periodo dei lavori di rettifica del corso del fiume.

Tabella X - Portate massime annuali al colmo del fiume Adige a Trento.

| PORTATE MASSIME AL COLMO IN m <sup>3</sup> /sec. |       |       |      |       |       |      |       |       |

(1) Dati delle pubblicazioni ufficiali.

(2) Portate al colmo rapportate alle ultime scale di deflusso per valutazioni idrologiche più omogenee.

◊ Dati ufficialmente mancanti, ma ricostruiti da altri elementi idrologici.

\* Portate virtuali.

E' una tabella con dati sufficientemente omogenei, nell'anno 1920 le grandi rettifiche del corso dell'Adige erano ultimate, il ponte a valle della stazione idrometrica era ad una sola campata fino alla guerra 1940-45, quando è stato sostituito da quello attuale. Essa riguarda i dati di 59 anni, dove sono indicati anche i valori virtuali di portata, ossia quelli che dovrebbero essere defluiti se non vi fossero state le rotte arginali. Questi dati possono essere un indice di base idrometrica per lo studio delle piene, che in un domani, per conoscere la situazione idrologica del fiume, vanno incrementati col preannuncio meteorologico e pluviometrico in tempi reali.
