| Dato interpolato | [ ] |

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

## CONTENUTO DELLE TABELLE

I dati sono trasmessi da Osservatori o stazioni termopluviometriche controllati o dipendenti direttamente dall'Ufficio.

Ogni stazione è fornita di un termometro a massima e a minima, che viene osservato ogni giorno alle ore 9 antimeridiane.

Le letture eseguite ai termometri vengono assegnate al giorno stesso dell'osservazione.

Le stazioni sono ordinate nelle tabelle secondo la rispettiva posizione idrografica.

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni termometriche che hanno funzionato nell'anno.

TABELLA I. - Sono riportati, per la maggior parte delle stazioni, i valori massimi e minimi rilevati giornalmente, le rispettive medie mensili, la temperatura media del mese e le corrispondenti medie del periodo.

In questo annale la media normale delle temperature è riferita al periodo 1960-79.

TABELLA II. - Per tutte le stazioni della tabella I sono riportate:

a) le medie mensili ed annue delle massime e delle minime temperature osservate giornalmente e le medie mensili ed annue delle temperature diurne. Come «temperatura diurna» è assunto il valore della semisomma delle temperature massima e minima osservate in uno stesso giorno;

b) le temperature estreme (massima e minima) osservate in ogni mese e nell'anno, ed il giorno nel quale sono state osservate.

Tutte le temperature riportate sono espresse in gradi centigradi e corrispondono alle letture effettivamente eseguite, non essendosi effettuata la riduzione al livello del mare.

### CONSISTENZA DELLA RETE TERMOMETRICA AL 31 DICEMBRE 1980

| Pluviometro registratore | Pr |
| Pluviometro totalizzatore | Pt |
| Precipitazione nulla | — |
| Precipitazione nevosa | * |
| Dato incerto | ? |
| Dato mancante | » |
| Dato interpolato | [ ] |

## TERMINOLOGIA

1. — Altezza di precipitazione (mm): quoziente del volume di acqua raccolta nel pluviometro (compresa, eventualmente, la neve sciolta) per l'area della superficie orizzontale dell'imbuto raccoglitore.

2. — Giorno piovoso: giorno in cui è stata misurata un'altezza di precipitazione uguale o superiore ad un millimetro.

3. — Ora di pioggia o piovosa: ora nella quale è stata registrata da un pluviografo un'altezza di precipitazione uguale o superiore a 0,2 mm.

4. — Intensità media di precipitazione in un dato intervallo di tempo: quoziente dell'altezza di precipitazione nell'intervallo per la durata di questo.

## CONTENUTO DELLE TABELLE

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni di osservazione che hanno funzionato nell'anno.

I valori delle precipitazioni riportati sono espressi in millimetri di acqua e comprendono pioggia e neve fusa.

TABELLA I. - Per ogni stazione riporta la quantità di pioggia caduta giornalmente ed i totali mensili ed annuo della precipitazione e del numero dei giorni piovosi.

Per le stazioni dotate di apparecchiatura a lettura diretta (pluviometri) le osservazioni vengono eseguite ogni giorno alle ore 9 ed il risultato viene attribuito al giorno stesso della misura: il valore segnato rappresenta quindi la quantità di precipitazione caduta nelle 24 ore che hanno preceduto la misura.

Per le stazioni dotate di pluviografo si riporta, per ogni giorno, la quantità di pioggia che nel diagramma risulta caduta nelle 24 ore comprese fra le ore 9 del giorno precedente e le ore 9 del giorno di cui si tratta.

Con carattere **grassetto** è stampato il massimo quantitativo giornaliero misurato per ogni mese.

TABELLA II. - Per le stesse stazioni di cui alla tabella I, riporta i totali mensili ed annui delle quantità di precipitazione.

Per ciascuna stazione è riportato in **grassetto** il più elevato dei valori mensili ed in *corsivo* il più basso.

TABELLA III. - Per le stazioni dotate di pluviografo riporta i dati relativi ai valori più elevati delle precipitazioni registrate, nell'anno, per 1, 3, 6, 12 e 24 ore consecutive appartenenti o non allo stesso giorno.

Sono considerate le precipitazioni iniziate dopo le ore 0 del primo gennaio e quelle, eventualmente terminate dopo le ore 24 del 31 dicembre.

TABELLA IV. - Riporta i massimi valori delle precipitazioni verificatesi per 1, 2, 3, 4 e 5 giorni consecutivi, appartenenti o non allo stesso mese. Sono considerati solamente i periodi il cui inizio cade entro l'anno anche se eventualmente sono terminati nell'anno successivo.

TABELLA V. - Riporta il valore, la durata e la data delle precipitazioni di maggiore intensità e di breve durata registrate dai pluviografi.

TABELLA VI. - Riporta per i mesi da gennaio a maggio e da ottobre a dicembre nei quali possono verificarsi precipitazioni nevose.

*a)* le altezze in centimetri degli strati nevosi sul suolo presenti nell'ultimo giorno delle tre decadi mensili;

*b)* il numero dei giorni nei quali si sono avute precipitazioni nevose (non sono conteggiati i giorni con valori di neve sciolta inferiore ad 1 mm).

*c)* il numero complessivo dei giorni di permanenza della neve sul suolo.

# Sezione C - METEOROLOGIA

Nel presente capitolo sono riportati per l'Osservatorio Meteorologico di Trento - Laste i valori della pressione atmosferica, dell'umidità relativa, dell'insolazione, del vento e della nebulosità. Sono riportati inoltre i valori della pressione atmosferica rilevati alla stazione di Pinzolo ed i valori dell'insolazione rilevati alla stazione del Careser. I dati della temperatura e delle precipitazioni sono riportati nelle rispettive Sezioni A e B.

## CONTENUTO DELLE TABELLE

TABELLA I. - Riporta i valori medi giornalieri, mensili ed annui della pressione atmosferica espressa in mm di mercurio, a zero gradi e non ridotta al mare.

TABELLA I/A. - Riporta i valori per decadi mensili della pressione atmosferica espressa in mm di mercurio a zero gradi e ridotta al mare, le medie mensili, i valori estremi e l'esecuzione.

TABELLA II. - Riporta i valori medi giornalieri, mensili ed annui dell'umidità relativa. Il valore dell'umidità relativa (espresso in centesimi) è quello del rapporto fra la tensione massima corrispondente alla temperatura rilevata durante l'osservazione.

TABELLA III. - Riporta il totale giornaliero, mensile ed annuo di insolazione espressa in ore.

TABELLA IV. - Riporta i valori mdi giornalieri, mensili ed annui della velocità del vento espressi in km/ora e contiene, inoltre, la direzione del vento prevalente durante il giorno e la durata in ore durante la quale esso ha soffiato, nonché la velocità media oraria massima e la sua direzione.

TABELLA IV/A. - Riporta le frequenze del vento nelle singole direzioni, cioè il numero d'ore in cui il vento soffiò nei dodici mesi ddell'anno, dalle 16 direzioni principali.

TABELLA V. - Riporta i valori medi giornalieri, mensili ed annui della nebulosità espressa in decimi di cielo coperto.

I valori giornalieri della pressione e dell'umidità sono calcolati in base a valori biorari, quelli della velocità del vento in base a valori orari, mentre quelli della nebulosità corrispondono alla media aritmetica delle osservazioni alle ore 7 - 14 - 19.

Per tutti gli elementi meteorologici riportati in questo capitolo, viene adottato il giorno civile, dalle ore 0 alle 24.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

# Sezione D - AFFLUSSI METEORICI

## TERMINOLOGIA

1. — Afflusso meteorico ($m^3$) ad un bacino idrografico in un dato intervallo di tempo: volume totale della precipitazione sul bacino in quell'intervallo.

2. — Altezza di afflusso meteorico (mm) ad un bacino idrografico per un determinato intervallo di tempo: spessore dello strato d'acqua di volume pari all'afflusso meteorico in quell'intervallo ed uniformemente distribuito sulla superficie del bacino.

3. — Contributo medio di afflusso meteorico ($l/s.km^2$) ad un bacino idrografico in un dato intervallo di tempo: quoziente fra l'afflusso meteorico al bacino nell'intervallo ed il prodotto della durata di questo per l'area del bacino.

## CONTENUTO DELLA TABELLA

Riporta, per gli interi bacini imbriferi e per le loro parti più importanti, le altezze di afflusso meteorico mensili ed annue, espresse in mm, ed i corrispondenti contributi medi espressi in $l/s.km^2$.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i massimi ed i minimi.

Valori mensili ed annui del contributo medio e dell'altezza di afflusso meteorico — *Anno 1980*

| Le quote sotto lo zero idrometrico sono precedute dal segno. | — |
| Idrometro che risente di manovre operate a monte | • |
| Quota approssimativa della località ov'è situato l'idrometro dedotta dalle tavolette dell'I.G.M. | * |
| Stazione del Decennio Idrologico Internazionale (D.I.I.). | □ |

## TERMINOLOGIA

1. — Altezza idrometrica (cm): altezza del livello liquido sopra o sotto lo zero dell'idrometro.

2. — Altezza di massima piena o magra in una sezione fornita di idrometro e per un lungo periodo di osservazione: massima o minima altezza idrometrica (cm) raggiunta in tutto il periodo di tempo in cui sono state effettuate le osservazioni.

3. — Altezza di piena ordinaria (cm) in una sezione fornita di idrometro e per un lungo periodo di osservazione (alcuni decenni): altezza idrometrica uguagliata e superata dalle massime altezze annue verificatesi nella sezione per il 75% degli anni di osservazione.

4. — Altezza di magra ordinaria (cm) in una sezione fornita di idrometro e per un lungo periodo di osservazione (almeno un decennio): altezza idrometrica uguagliata e superata dalle minime altezze verificatesi nella sezione per il 75% degli anni di osservazione.

## CONTENUTO DELLE TABELLE

La tabella è preceduta dall'elenco e caratteristiche delle stazioni idrometriche che hanno funzionato nell'anno.

TABELLA I. - Riporta, per alcune stazioni, le altezze idrometriche rilevate direttamente all'idrometro da parte dell'osservatore oppure dedotte in corrispondenza del mezzogiorno dallo spoglio ddei diagrammi per le stazioni fornite di apparecchio registratore.

### CONSISTENZA DELLA RETE IDROMETRICA AL 31 DICEMBRE 1980

| Chiese a Lodrone | Mr • | 370,00* | 313 | 1959 | |

* Quote approssimative.
(1) La quota dello zero idrometrico (448.01) vale dal 15.2.79. La vecchia quota era di 448.23 m.
(2) L'altezza di massima piena è stata superata nel novembre 1966, ma causa l'asportazione dello strumento non è stato possibile ricavarne il dato.
(3) In seguito alla costruzione degli impianti idroelettrici di Pozzolago, il bacino del lago delle Piazze (kmq. 2,0), prima appertenente al bacino del Fersina, viene a fare parte del bacino dell'Avisio. È stata quindi apportata tale variante alla superficie del Fersina e dell'Adige a Trento.
(4) Dal mese di agosto le altezze idrometriche del lago di Canzolino sono influenzate da pompaggi.
(5) La quota dello zero idrometrico (375,89) vale dal 22.11.79. La vecchia quota era di 374.00 m.

Non sono riportate le osservazioni delle stazioni stampate in corsivo.

## TERMINOLOGIA

1. — Portata in una sezione e in un dato istante ($m^3/s$): volume di acqua che attraversa la sezione durante l'unità di tempo (minuto secondo) che comprende quell'istante.

2. — Portata unitaria (o contributo) relativa ad una determinata sezione $l/s\ km^2$: rapporto tra la portata nell'unità di tempo (s) e l'area del bacino imbrifero sotteso dalla sezione.

3. — Portata media in una sezione e per un dato intervallo di tempo: rapporto tra il deflusso relativo all'intervallo e la durata di questo.

4. — Modulo di una sezione: portata media di un gran numero di anni.

5. — Portata giornaliera in una sezione e per un determinato giorno: portata media nella sezione in quel giorno.

6. — Durata di una determinata portata Q in una sezione e relativamente ad un certo intervallo di tempo: numero di giorni di quell'intervallo, nei quali si è verificata una portata non inferiore a Q.

7. — Portata semipermanente in una sezione e in un dato intervallo di tempo: portata che non è stata superata per metà dei giorni dell'intervallo (ossia di durata uguale e metà dell'intervallo).

8. — Portata semiannuale di un anno determinato: la portata semipermanete di quell'anno.

9. — Deflusso di una determinata sezione e per un determinato intervallo di tempo ($m^3$): volume liquido che ha attraversato la sezione nell'intervallo.

10. — Altezza di deflusso di un bacino idrografico per un determinato intervallo di tempo (mm): spessore dello strato d'acqua di volume pari al deflusso superficiale del bacino in quell'intervallo e uniformemente distribuito sulla superficie del bacino.

11. — Deflusso giornaliero in una determinata sezione e per un dato giorno ($m^3$): volume liquido che ha attraversato la sezione in quel giorno.

12. — Deflusso unitario relativo ad una determinata sezione ed in un dato intervallo di tempo ($m^3/km^2$): rapporto tra il deflusso dell'intervallo e l'area del bacino imbrifero sotteso dalla sezione.

13. — Perdita apparente di un bacino idrografico in un determinato intervallo di tempo: differenza fra l'altezza di afflusso meteorico e l'altezza di deflusso relative all'intervallo.

14. — Coefficiente di deflusso di un bacino idrografico in un determinato intervallo di tempo: rapporto tra l'altezza di deflusso e l'altezza di afflusso meteorico relative all'intervallo.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi.

## CONTENUTO DELLE TABELLE

Le tabelle sono precedute da una cartina della Provincia, corredata da un elenco, ove sono ubicate le stazioni di misura che hanno regolarmente funzionato nell'anno.

Nelle tabelle, per ogni stazione, sono riportati:

*a)* le caratteristiche della stazione e del bacino che alimenta il corso d'acqua relativo.

*b)* le portate medie giornaliere espresse in $m^3/s$;

*c)* gli elementi caratteristici mensili ed annui, dell'anno e del precedente periodo di osservazione (le portate in $m^3/s$, massime, minime e medie giornaliere, i deflussi e gli afflussi in mm; i coefficienti di deflusso - rapporto tra i deflussi e i corrispondenti afflussi);

*d)* le portate medie giornaliere corrispondenti a valori caratteristici delle durate espresse in giorni;

*e)* la scala numerica delle portate, cioè la traduzione analitica della relazione intercorrente tra le portate e le altezze idrometriche rilevate nella sezione di misura.

## ELENCO DELLE STAZIONI

*1 - Brentella di Caldonazzo a Brenta*

*2 - Brentella di Levico a Levico*

3 - Brenta a Levico P.te Cervia

4 - Brenta a Borgo Valsugana

5 - Rabbies a S. Bernardo di Rabbi

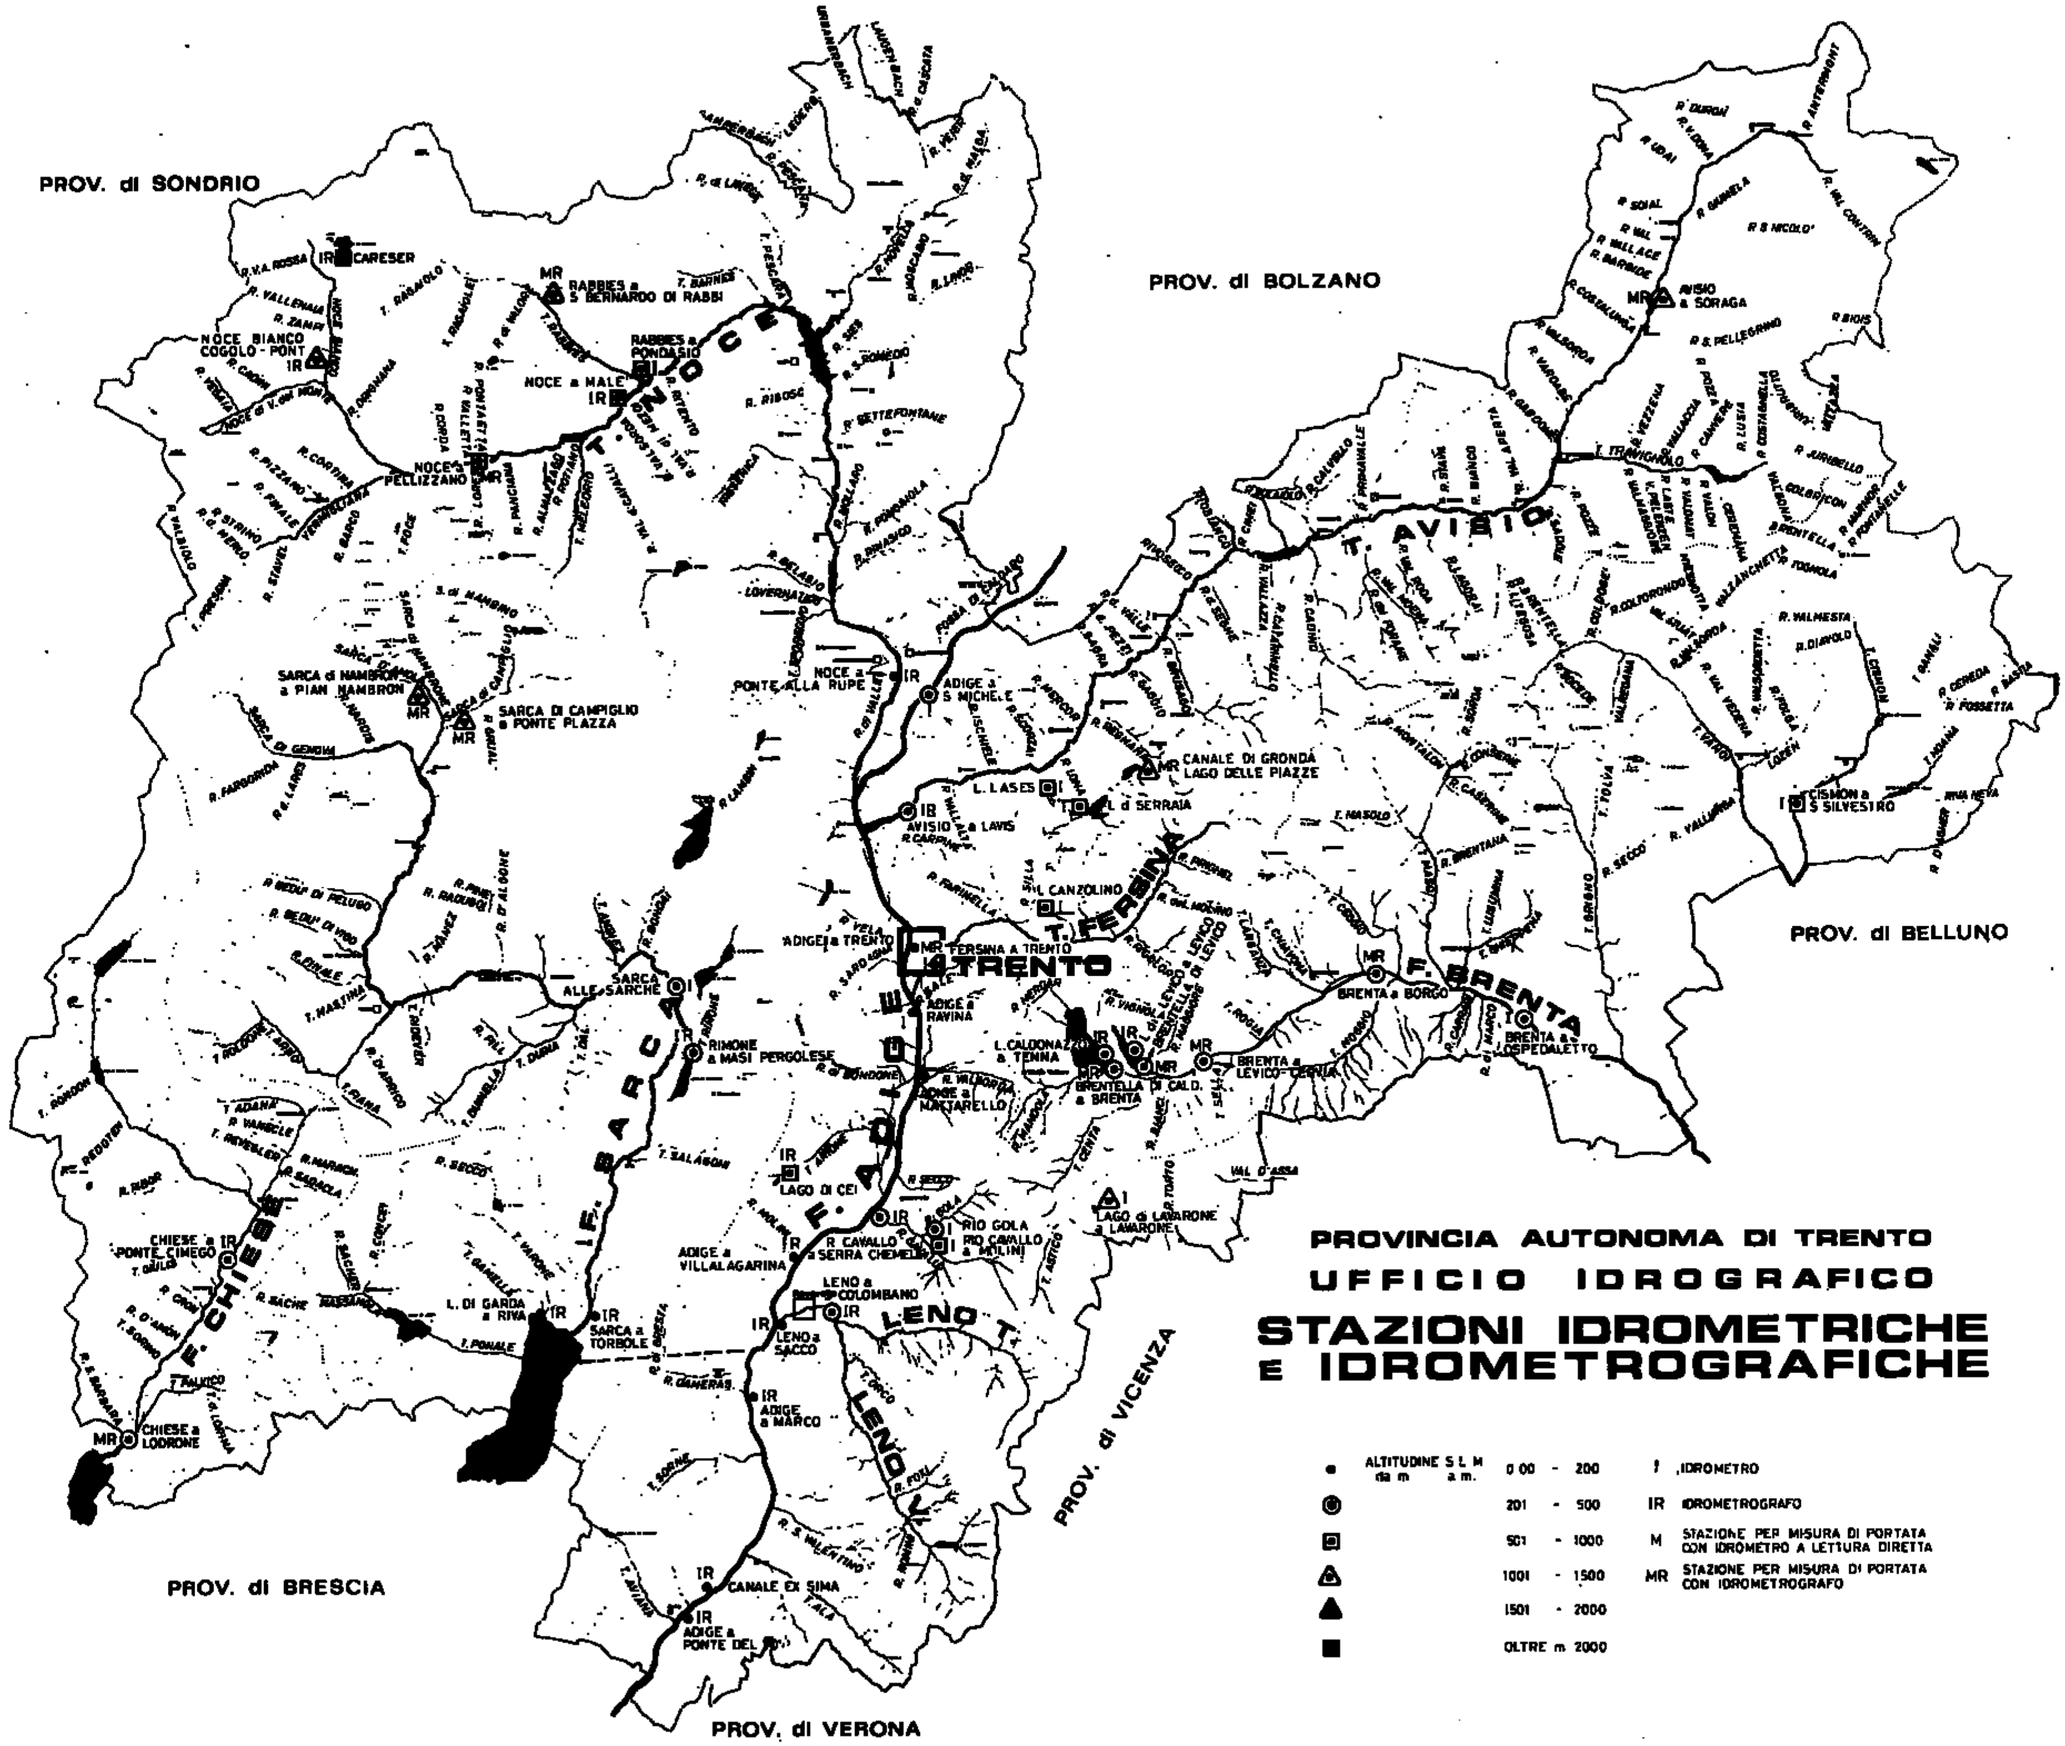
6 - Avisio a Soraga

7 - Canale di gronda Lago delle Piazze

8 - Adige a Trento

9 - Sarca di Nambrone a Pian Nambron

10 - Sarca di Campiglio a P.te Plazza



PROVINCIA AUTONOMA DI TRENTO

# Sezione G - FREATIMETRIA

**Abbreviazioni e segni convenzionali**

| | |
|---|---|
| Stazione freatimetrica a lettura diretta | F |
| Stazione freatimetrica registratrice | Fr |
| Dato incerto | ? |
| Dato interpolato | [ ] |
| Dato mancante | » |
| Pozzo asciutto | asc. |

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi.

## TERMINOLOGIA

Altezza freatimetrica (m): altezza del livello liquido nel pozzo sul livello del mare.

## CONTENUTO DELLA TABELLA

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni freatimetriche che hanno funzionato nell'anno.

TABELLA I - Riporta i valori giornalieri dei livelli freatici, riferiti al medio mare, il valore medio mensile ed annuo.

Elenco e caratteristiche delle stazioni freatimetriche — *Anno 1980*

| BACINO E STAZIONE | Tipo della stazione | COORDINATE GEOGRAFICHE | | Anno dell'inizio delle osservazioni | QUOTA SUL MEDIO MARE | | | | | Media dell'anno 1980 |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Longitudine Ovest (Monte Mario) | Latitudine Nord | | del caposaldo di riferimento m | del livello massimo raggiunto nell'anno | | del livello minimo raggiunto nell'anno | | |
| | | | | | | m | data | m | data | |
| **ADIGE** | | | | | | | | | | |

# CARATTERI IDROLOGICI DELL'ANNO 1980

I valori rilevati all'Osservatorio meteorologico di Trento (Laste) ed in alcune stazioni termopluviometriche, idrometriche e di misura delle portate, opportunamente scelte nella provincia, sono messi a confronto con i rispettivi valori medi di un lungo periodo di osservazioni (valori normali).

## I — TEMPERATURA

La temperatura media annua alla stazione di Trento (Laste), come risulta dalla tab. I, si differenzia dal valore normale di 0,1 °C in meno.

Scostamenti più accentuati delle medie mensili dai valori normali si notano nei mesi di agosto e settembre.

Dalla tab. II, dove i valori delle temperature medie stagionali sono posti a confronto, con i rispettivi valori normali, si nota come la primavera e l'estate siano stati, alla stazione di Trento, di poco più freddi del normale.

Le temperature medie stagionali dell'inverno e dell'autunno sono superiori ai valori normali: si distanziano comunque di poco dalla media del periodo.

I massimi ed i minimi assoluti dell'anno sono contenuti negli estremi sinora osservati.

## II — PRESSIONE ATMOSFERICA

La pressione atmosferica media annua registrata all'Osservatorio di Trento (Laste q.ta 312 m.s.m.) è stata di mm 732,8 essa è inferiore di 1,0 al valore normale.

Ad eccezione dei mesi di febbraio, aprile, settembre e dicembre con pressioni medie mensili superiori ai valori normali rispettivamente di mm 2,7, mm 0,3, mm 0,3 e mm 0,5, nei rimanenti mesi la pressione media mensile è stata inferiore alla media normale con scostamenti compresi tra mm -06 di gennaio e mm -3,6 di ottobre.

Il valore massimo della pressione giornaliera si nota nel mese di dicembre, ed è pari a 747.0 mm mentre quello minimo si è registrato nel mese di marzo con 718,7 mm.

## III — VENTO

La velocità media annua del vento nel 1980 (tab. III) all'Osservatorio di Trento (Laste) è stata inferiore al valore normale.

I valori medi mensili della velocità del vento sono inferiori, tranne a settembre, ai rispettivi valori normali: la differenza massima si nota nel mese di febbraio con km/h 2,3 in meno.

La massima velocità media mensile si è registrata in aprile.

La massima velocità oraria è stata registrata nel mese di novembre con Km/h 38 da NW.

## IV — UMIDITÀ RELATIVA

La media annua dell'umidità relativa del 1980 a Trento (Laste) (tab. IV) è stata inferiore di 4 centesimi alla media normale.

Il mese più asciutto per Trento è stato aprile; la maggiore umidità è stata registrata nei mesi di ottobre e novembre.

L'umidità media mensile è stata superiore al normale nei mesi di marzo e novembre; nei rimanenti è risultata inferiore od uguale alla media normale.

Il maggiore scostamento positivo dal valore normale si registra nel mese di marzo con 3 centesimi; quello negativo ad aprile con 16 centesimi.

## V — PRECIPITAZIONI

La tav. V è utile per confrontare i valori mensili ed i totali annui delle precipitazioni del 1980 con quelli di un periodo di osservazioni più lungo.

La caratteristica saliente del regime mensile delle precipitazioni è data dalla scarsità degli afflussi meteorici osservati nei mesi di aprile e settembre.

Dall'esame dei valori riportati nella tab. VI si nota come la primavera sia stata la stagione meno piovosa.

## PRECIPITAZIONI NEVOSE

Nella tab. VI, a pag. 72 e seguenti della sezione B, per le stazioni nelle quali vèngono fatte osservazioni nivometriche, sono riportate le altezze del manto nevoso rilevate il giorno 10, il giorno 20 e l'ultimo giorno del mese. Vengono inoltre evidenziati i totali mensili dei giorni con precipitazioni nevose e quelli di permanenza della neve al suolo.

Le maggiori precipitazioni nevose si sono registrate durante il mese di gennaio.

## VI — IDROMETRIA

Nella «Sezione E - Idrometria» sono riportate le caratteristiche delle stazioni idrometriche e, per le stazioni che hanno funzionato regolarmente tutto l'anno, le altezze idrometriche meridiane e le rispettive medie mensili ed annue.

Nell'elenco e caratteristiche delle stazioni idrometriche, la quota dello zero idrometrico (m.s.m.) di ciascuna stazione si riferisce ovviamente all'idrometro attuale; nella parte iniziale della sezione E si sono volutamente tralasciate le altezze idrometriche massime e minime registrate in epoca storica in quanto non si ha la certezza della coincidenza fra gli zeri idrometrici attuali e passati.

I valori massimi delle altezze idrometriche medie mensili si registrano prevalentemente: nel mese di gennaio nel bacino del Brenta e nel mese di giugno nel bacino del fiume Adige, del fiume Sarca e del fiume Chiese.

I valori minimi delle alteze idrometriche medie mensili si registrano prevalentemente: nel mese di settembre nel bacino del Brenta, nel mese di dicembre e febbraio nel bacino dell'Adige e nei mesi di febbraio e marzo nei bacini del Sarca e del Chiese.

È però da tener presente che, sia sui livelli idrometrici massimi ed ancor più sui livelli minimi dell'anno, hanno influenzato le alterazioni provocate dall'azione regolatrice dei serbatori idroelettrici.

Nelle tab. VII sono riportate, per alcune stazioni, le altezze idrometriche massime e minime assolute dell'anno.

*Tabella VII* - Altezze idrometriche massime e minime assolute del 1980

## VII — PORTATE E BILANCI IDROLOGICI

Nella «Sezione F - portate e bilanci idrologici» sono esposti i valori delle portate medie giornaliere, mensili ed annue per n. 8 sezioni di corsi d'acqua, nelle quali sono state eseguite sistematiche misure di portata e per le quali è stato possibile tracciare regolari scale di deflusso.

Per le sezioni, il cui regime di deflusso non è alterato da derivazioni o da operazioni d'invaso e svaso dei serbatoi, sono stati calcolati i relativi bilanci idrologici mediante il confronto fra i deflussi e gli afflussi meteorici.

Dall'esame dei valori esposti nella tab. VIII, che riporta per le diverse sezioni di misura il confronto tra i valori delle portate del 1980 ed i corrispondenti valori dei precedenti periodi di osservazione, si rileva che le portate medie annue sono generalmente superiori ai valori medi del periodo nei mesi di gennaio, febbraio e marzo ed inferiori negli altri mesi con un minimo in settembre.

I valori massimi delle portate medie mensili si notano: nel mese di gennaio sul fiume Brenta, nel mese di giugno sul fiume Adige e sul fiume Sarca.

I valori minimi delle portate medie mensili si notano: nel mese di settembre nel bacino del Brenta; nel mese di febbraio sul fiume Adige e sul fiume Sarca.

Le portate massime giornaliere si notano: su tutti i bacini in occasione della piena del 17 ottobre.

Le portate minime giornaliere si notano: nei mesi di aprile e dicembre sul fiume Brenta, nel mese di dicembre sul fiume Adige; nel mese di febbraio sul fiume Sarca.

*Tabella VIII* - Confronto fra le portate medie mensili ed annue (in $m_3/s$) del 1980 e quelle del periodo di osservazione

| STAZIONE | PERIODO | Gennaio | Febbraio | Marzo | Aprile | Maggio | Giugno | Luglio | Agosto | Settembre | Ottobre | Novembre | Dicembre | Anno |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

# EVENTO DI PIENA DEL 17-18 OTTOBRE 1980

Nei giorni 17 e 18 ottobre 1980 un evento di piena di notevoli proporzioni ha interessato i corsi d'acqua della Provincia, anche se con caratteristiche diverse da bacino a bacino.

I valori delle precipitazioni che hanno causato l'evento, pur non raggiungendo quelli dell'alluvione del novembre 1966, sono stati comunque notevoli e falsati, in molti casi, dall'apporto dovuto allo scioglimento di un consistente manto nevoso presente a quote superiori ai 1700 m per un rialzo termico in presenza di venti caldi provenienti dai quadranti meridionali.

Nel bacino del fiume Brenta (vedi figura n. 1) le precipitazioni hanno raggiunto intensità oraria anche di 11 e 12 mm ed hanno causato un graduale innalzamento del livello del lago di Caldonazzo ed un conseguente costante aumento della portata del suo emissario, la Brentella di Caldonazzo, mentre la repentina crescita dei livelli idrometrici registrata nel fiume Brenta nelle sezioni di Ponte Cervia e Borgo Valsugana indica l'importanza che ha assunto nei deflussi del Brenta il contributo del torrente Centa, suo importante affluente di destra.

La portata massima del torrente Cismon in arrivo al serbatoio di Schener (che sottende un bacino imbrifero di 197 kmq), ed opportunamente laminata da quest'ultimo, è stata pari a 254 $m^3/s$, assai inferiore a quella che si verificò nel novembre 1966 pari a 638 $m^3/s$.

Nel bacino del fiume Sarca le precipitazioni medie ragguagliate sull'intero bacino (vedi figura n. 2), pur non raggiungendo valori come quelli registrati sul bacino del Brenta, sono state sufficienti ad incollare il livello idrometrico del fiume Sarca a Torbole, a monte dello scarico della centrale E.N.E.L., ad una quota massima di m 3,10 sullo zero idrometrico, cui ha corrisposto una portata di 352 $m^3/s$ che, aggiunta a quella scaricata dalla centrale e pari a 70 $m^3/s$, ha innalzato a $m^3/s$ 422 la portata massima entrante nel lago di Garda direttamente dal fiume Sarca.

Dall'andamento dei livelli nel lago di Garda a Riva si è notato un incremento di 28 cm dalle ore 12 del 16/10 alle ore 24 del 18/10 corrispondenti a circa 105 milioni di $m^3$: di questi, 35,5 sono giunti tramite il Sarca (bacino di kmq 1042), 43 dal bacino proprio del lago di Garda (1181 kmq) e 26,5 tramite la galleria Adige-Garda.

La piena del fiume Chiese è stata quasi completamente trattenuta nei serbatoi di Malga Bissina e Malga Boazzo con uno scarico massimo da quest'ultimo pari a 94 $m^3/s$ dei quali 26 turbinati nella sottostante centrale di Cimego e 68 scaricati.

La piena del fiume Adige ed affluenti (altezza massima raggiunta a Trento-S. Lorenzo m 5,32 cui corrisponde una portata di 1815 $m^3/s$) è stata di una certa gravità causa la sovrapposizione dei colmi di piena provenienti dagli affluenti Noce ed Avisio con quello proprio dell'Adige.

Il torrente Noce è stato opportunamente laminato dal serbatoio di S. Giustina che ha ridotto la portata al colmo dai 452 $m^3/s$ in arrivo al serbatoio ai totali uscenti 325 $m^3/s$ di cui 68 $m^3/s$ turbinati e 257 $m^3/s$ scaricati (vedi figura n. 3).

All'idrometro di p.te alla Rupe il colmo del Noce è giunto alle ore 18.30 del giorno 17 con una portata di 412 $m^3/s$ e si è sommato a quello dell'Avisio che all'idrometro di Lavis è transitato alle ore 19,00 con una portata di $m^3/s$ 530 (vedi figura n. 4).

I due colmi sono riuniti quindi in Adige un paio d'ore prima di quello proprio dell'Adige stesso proveniente dalla provincia di Bolzano ed hanno evidentemente contribuito ad innalzare la portata al colmo dell'Adige a Trento che ha raggiunto il valore massimo di $m^3/s$ 1815 verso le ore 23,00 del giorno 17 (vedi figura n. 5).

IL RESPONSABILE DELL'UFFICIO IDROGRAFICO
ing. Roberto Bertoldi
